

AI-Based Medical Diagnosis System

Project Overview:

This project is an AI-based medical diagnosis system that predicts diseases based on user symptoms using an external API. It provides recommendations such as medicines, diet, workout, and precautions.

Features:

- User Authentication (Login/Register)
- Symptom-based Disease Prediction
- PDF Report Generation
- Email Sending Functionality
- Nearby Hospital Suggestions
- BMI Calculator (Separate Module)
- History Tracking
- Dashboard with Pie Chart Visualization

Technologies Used:

- Frontend: HTML, CSS, JavaScript
- Backend: Python, Flask
- Database: SQLite
- API: Groq API (LLM)
- PDF: ReportLab
- Email: SMTP
- Visualization: Chart.js

Workflow:

1. User logs in or registers.
2. User enters symptoms.
3. System sends data to AI API.
4. API returns prediction and recommendations.
5. Results are displayed and stored.
6. User can download PDF or send email.

7. History is used to generate dashboard charts.

Conclusion:

The system provides a simple and efficient way to predict diseases using AI and enhances usability with additional features like reports, email, and analytics.
